

SHAP dependence for DBP: nonlinear effect (black line) + top interacting feature (color, with interaction strength)

pNN50 = % of RR intervals differing >50 ms; dias. width 25% = diastolic width at 25% pulse height; PPG p10 = 10th percentile of PPG amplitude; APG d-time = time from foot to APG d landmark; APG e/a = APG e-wave / a-wave amplitude; HF power = PPG power in 5-10 Hz band; QRS amp = median R-wave amplitude; APG e-time = time from foot to APG e landmark; VPG min = min PPG velocity (steepest downslope); PPG p25 = 25th percentile of PPG amplitude; dias. width 10% = diastolic width at 10% pulse height; amp CV = beat-to-beat amplitude CV
