

SHAP dependence for SBP: nonlinear effect (black line) + top interacting feature (color, with interaction strength)

PPG skew = skewness of the PPG segment; APG c-time = time from foot to APG c landmark; APG e/a = APG e-wave / a-wave amplitude; PPG p10 = 10th percentile of PPG amplitude; dias. width 10% = diastolic width at 10% pulse height; APG e-time = time from foot to APG e landmark; APG d-time = time from foot to APG d landmark; PPG p25 = 25th percentile of PPG amplitude; HF power = PPG power in 5-10 Hz band; dias. width 25% = diastolic width at 25% pulse height; VPG ratio = max/[min] PPG velocity; VPG min = min PPG velocity (steepest downslope)
